<sup>1/</sup> This work was supported by funds provided by the U.S. Fish and Wildlife Service, Comprehensive Assessment & Monitoring Program (CAMP), as part of a cooperative agreement with the California Department of Fish and Game pursuant to the Central Valley Project Improvement Act (PL. 102-575).

## ABSTRACT

The California Department of Fish and Game conducted an angler survey on the Sacramento River and six major tributaries between April and December 1998. The purpose of the survey was to estimate the in-river effort and harvest of nine sport fish species. Thirty eight thousand nine hundred twenty-two anglers were surveyed and they spent an estimated 3,079,837 angler-hours sport fishing. Chinook salmon was the target of most anglers, having expended 1,330,017 angler-hours in pursuit of this species. Striped bass was the second most sought species with 1,141,327 angler-hours expended targeting this species. The most common fish in angler's creel was chinook salmon. Anglers harvested an estimated 84,181 chinook salmon. Striped bass and catfish were also abundant in anglers' creel. Anglers harvested an estimated 83,503 striped bass and 66,372 catfish.

## INTRODUCTION

Native anadromous fish stocks in many Central Valley rivers and streams have declined to such a critical level that many stocks are currently listed or are candidates for listing under the Endangered Species Act. In an effort to restore the abundance of natural stocks, the Central Valley Project Improvement Act (CVPIA) was enacted in October, 1992. This Act calls for the development of restoration actions that ensure long-term sustainable populations of native anadromous fish stocks. To evaluate the effectiveness of these restoration actions the Comprehensive Assessment and Monitoring Program (CAMP) was developed under Section 3406(b)(16) of the Act.

To assist in the CAMP monitoring program, the California Department of Fish and Game (CDFG) developed the Central Valley Salmon and Steelhead Harvest Monitoring Project. The CDFG has used angler surveys in past efforts to monitor the harvest of anadromous fish within Central Valley rivers and streams. Unfortunately, no comprehensive or long-term (more than 5 years) surveys have been made on a consistent basis. This project is designed as long-term monitoring program to determine annual estimates of total in-river harvest of sport fish from the Sacramento River and major tributaries. The data will also complement and enhance other ongoing CDFG harvest monitoring programs such as Department's adult striped bass, adult sturgeon and ocean salmon harvest.

## STUDY AREA

The study area consists of 554 miles of the Sacramento River and major tributaries which were divided into 18 sampling sections. The rivers comprising the study area are: Sacramento River from Carquinez Bridge upstream to the Anderson-Cottonwood Irrigation District (ACID) Dam in Redding (eight sections); Feather River from its confluence with the Sacramento River at Verona upstream to the Oroville Project Fish Barrier Dam in Oroville (three sections); Yuba River from the confluence with the Feather River near Marysville to one mile upstream of the Hwy. 20 bridge crossing (two sections); American River from its confluence with the Sacramento River at Discovery Park upstream to Nimbus Dam (three sections); San Joaquin River from its confluence with the Sacramento River upstream to Mossdale Crossing near Tracy (one section); South Fork Mokelumne River from its confluence with the San Joaquin River upstream to Interstate 5 Bridge crossing including the North Fork Mokelumne River (two sections); Stanislaus River from McHenry Avenue bridge near Meyers upstream to Goodwin Dam (one section) (Figure 1).

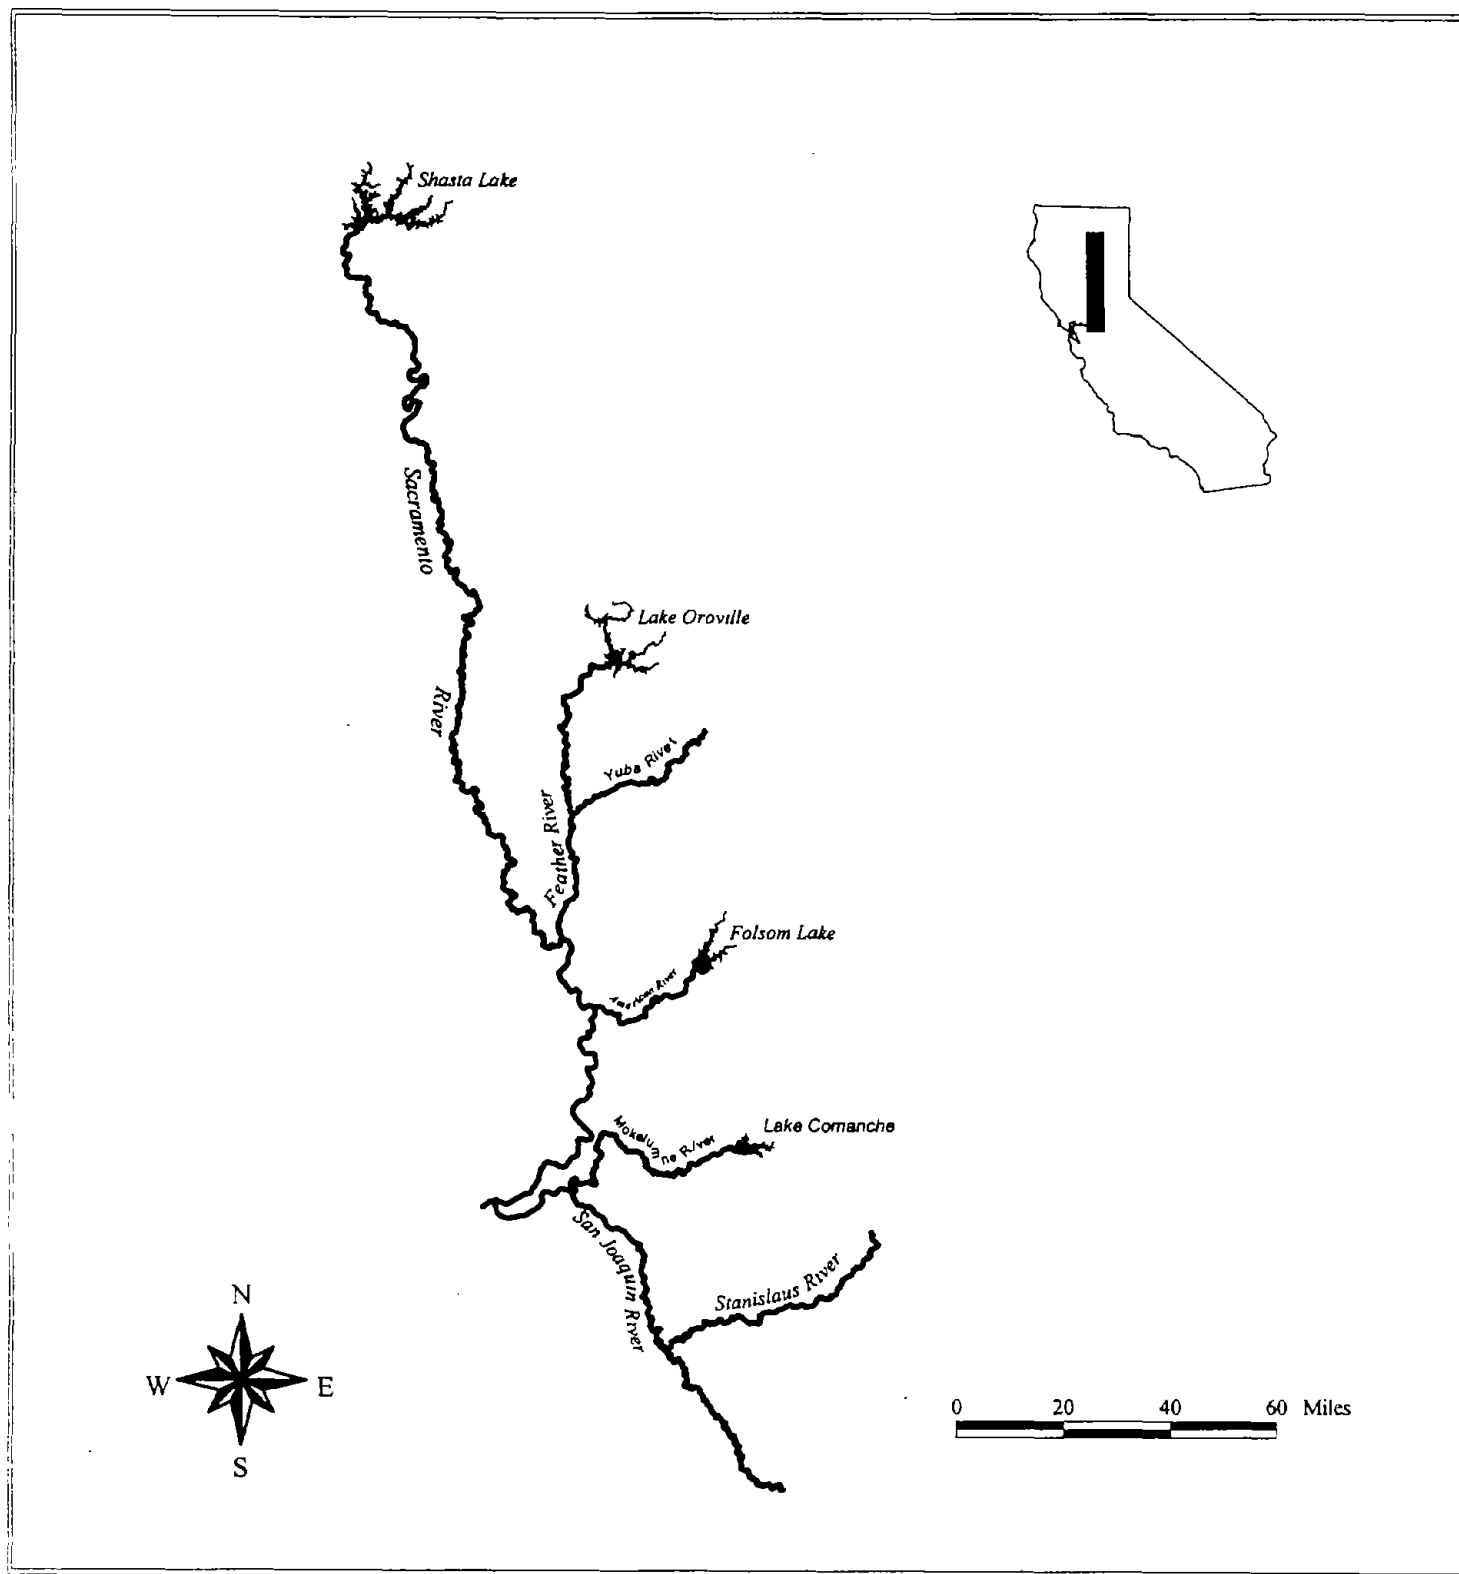

Figure 1. Angler Survey Rivers

## PROCEDURES

### Statistical Design

A stratified random sample design, based on the design used by the Sacramento River System Sport Fish Inventory (Wixom, 1995) was used to estimate the in-river harvest during the daytime sport fishery. While a night fishery exists in the Central Valley rivers, no effort was made by this survey to evaluate the harvest by night time sport anglers.

A total of eighteen sections was sampled. Sixteen sample sections ranged in length from 4 to 58 river miles. Two sample sections, which represented unique fisheries, were approximately one river mile in length. Sampling schedules and data summaries were compiled on a monthly basis. Months were arbitrarily chosen as sample periods.

All sample sections were surveyed eight randomly selected times each month - four weekdays and four weekend days. Weekdays and weekend days were placed in separate strata because more angling effort is commonly associated with weekend days.

All sample sections were surveyed by kayaks or power boats with the exception of the Stanislaus River. Kayaks were used in shallow upstream reaches while power boats were used in rivers where tides, wind, and waves demanded the use of more seaworthy boats. The Stanislaus River was sampled by visiting designated access points between McHenry Avenue bridge and Goodwin Dam. If vehicle(s) are present at an access point, then the creel clerk tries to locate the angler(s) by hiking along the stream bank until found. Sampling below McHenry Avenue bridge is not feasible because of the limited public access and difficulty in locating anglers.

For each section surveyed, a random start time and launch location was chosen. Start times were classified as either early or late. An early start time was scheduled to begin ½ hour after sunrise, while a late start time would vary depending on length of section and time of year. Typically, a late start time was scheduled so that the survey would end at or near sunset. Launch locations would either be at the upstream or downstream end of the sections to be surveyed. In those sections where kayaks were used, the launch location was always at the upstream end of the section.

All data collected were linked by river mile. Actual river miles were used for the Sacramento River sections. Each tributary was given a unique number series to identify it from other rivers in the database. The number series assigned to each tributary were as follows: Feather River, 400 series; American River, 500 series; Yuba River, 600 series; San Joaquin River, 700 series; South Fork Mokelumne River, 800 series; North Fork Mokelumne River, 900 series; Stanislaus River, 1000 series. River mile designations were marked in ascending order from downstream to upstream.

## Data Collection

Three field data sets were required to calculate use and catch: hourly counts, angler counts, and angler interviews. Hourly counts determined the portion of the whole represented by the sample day angler count. For this survey, hourly counts collected by Wixom (1995) were used. Where hourly count data was unavailable, data sets were developed by using the hourly counts of representative rivers.

On each sampling day, the procedure was to make a high speed pass to the end of the section. This first pass was called the angler count. Data collected during the angler count included: time of observation, location by river mile, number of boats, number of boat anglers, and the number of shore anglers. At the end of the angler count, a second pass was made traveling back through the section to conduct angler interviews. Prior to beginning the interviews, the survey crew determined the feasibility of interviewing all anglers counted during the angler count. If it was determined that this was not feasible, then they randomly chose a  $N^{\text{th}}$  angler to be interviewed. Once a  $N^{\text{th}}$  angler interval was chosen, that interval was maintained through the entire section for that survey date. Data collected during each interview included: location by river mile, fishing method, number of hours fished, number of anglers in group, target species, zip code, whether the trip was completed, and the number of fish kept and released by species.

Nine sport fish species found in the Central Valley rivers were considered 'Target Species'. Those species were: chinook salmon, steelhead, rainbow trout, striped bass, sturgeon (all species), American shad, catfish (all species), sunfish (all species), and black bass (all species) (Table 1). If anglers did not indicate they were fishing for one of the target species, the code 'ANY' was used.

The number of fish kept and released was recorded separately for each of the nine target species. All other fish species caught were recorded separately by species in a column labeled "Other" (Table 2).

A length measurement was used to differentiate between steelhead and rainbow trout. All rainbow trout 18" or greater were considered to be steelhead. Rainbow trout less than 18" were recorded as rainbow trout (McEwan, 1998)<sup>1</sup>.

Additional data were collected from five of the nine target species when kept by anglers. The five species were: chinook salmon, steelhead, rainbow trout, striped bass and sturgeon. Each fish was measured to the nearest .5 centimeter fork length and inspected for any marks or tags. A total length measurement was taken on sturgeon. All chinook salmon and steelhead caught were inspected for the presence of an adipose fin. A salmon or steelhead missing an adipose fin indicated the fish was of hatchery origin and likely contained a coded-wire tag (CWT) in its head. The head was removed from adipose fin clipped fish and sent to the CDFG Ocean Salmon Project laboratory in Healdsburg for later analysis.

Table 1. Species symbols, common and scientific names of target species observed in the 1998 Angler Survey, April 1 through December 31, 1998.

Family	Target Species	Species Symbol	Common Name	Scientific Name
Salmonidae:	Chinook Salmon	KS	King Salmon	<i>Oncorhynchus tshawytscha</i>
	Steelhead	SH	Steelhead Trout	<i>Oncorhynchus mykiss</i>
	Rainbow Trout	RT	Rainbow Trout	<i>Oncorhynchus mykiss</i>
Perichthyidae:	Striped Bass	SB	Striped Bass	<i>Morone saxatilis</i>
Acipenseridae:	Sturgeon	ST	White Sturgeon	<i>Acipenser transmontanus</i>
			Green Sturgeon	<i>Acipenser medirostris</i>
Clupeidae:	American Shad	AS	American Shad	<i>Alosa sapidissima</i>
Ictaluridae:	Catfish	CF	Channel Catfish	<i>Ictalurus punctatus</i>
			White Catfish	<i>Ameiurus catus</i>
			Brown Bullhead	<i>Ameiurus nebulosus</i>
			Black Bullhead	<i>Ameiurus melas</i>
Centrarchidae:	Sunfish	SF	Bluegill	<i>Lepomis macrochirus</i>
			Redear Sunfish	<i>Lepomis microlophus</i>
			Black Crappie	<i>Pomoxis nigromaculatus</i>
	Black Bass	BB	Largemouth	<i>Micropterus salmoides</i>
			Smallmouth	<i>Micropterus dolomieu</i>
			Spotted Bass	<i>Micropterus punctulatus</i>
Other:	Any Species	ANY	The "ANY" designations was used for anglers who indicated they were not fishing for a specific species.	

Table 2. Non-target species symbols, common and scientific names of species observed in the 1998 Angler Survey, April 1 through December 31, 1998.

Family	Common Name	Species Symbol	Scientific Name
Cyprinidae:	Common Carp	CP	<i>Cyprinus carpio</i>
	Hardhead	HH	<i>Mylopharodon conocephalus</i>
	Splittail	SPT	<i>Pogonichthys macrolepidotus</i>
	Squawfish	SQ	<i>Ptychocheilus grandis</i>
Catostomidae:	Sacramento Sucker	SKR	<i>Catostomus occidentalis</i>
Pleuronectidae:	Starry Flounder	STR	<i>Platichthys stellatus</i>
Sciaenidae:	White Croaker (Kingfish)	KF	<i>Genyonemus lineatus</i>

## Estimate Calculations

Sample day estimates for angler-hours were created by dividing the observed angler count by the average hourly count within the respective hour interval. The mean of the sample days within a stratum was expanded by the number of days available in the month to obtain the total for the stratum. For each month and section, weekend and weekday strata were combined for total estimated angler-hours as follows:

$$\text{TOTALAH}_i = ((\text{ALLWD}_i * \text{WDAVG}_i) + (\text{ALLWE}_i * \text{WEAVG}_i))$$

$\text{TOTALAH}_i$  = total angler-hours (the subscript i denotes the stratum containing a particular combination of section and month).

$\text{ALLWD}_i$  and  $\text{ALLWE}_i$  = number of weekdays and weekend days, respectively available in the month.

$\text{WDAVG}_i$  and  $\text{WEAVG}_i$  = mean of expanded sample-day angler-hours for weekdays and weekend days, respectively.

Hourly count data was not available for all rivers surveyed. For example, Feather River hourly counts were used with Yuba River angler count data; Sacramento River counts were used with San Joaquin River and Mokelumne River angler count data; and American River hourly counts were used with Stanislaus River angler count data.

Angler hour estimates were scaled down to each species by multiplying the total angler-hours by the observed percent distribution of effort for each target species:

$$\text{TOTALAHSP}_{ij} = \text{TOTALAH}_i * \text{FISHHRS}_{ij}$$

$\text{TOTALAHSP}_{ij}$  = estimated angler-hours (subscript i denotes the stratum containing a particular combination of section and month, j denotes target species)

$\text{TOTALAH}_i$  = total angler-hours (the subscript i denotes the stratum containing a particular combination of section and month).

$\text{FISHHRS}_{ij}$  = the ratio of the sample total angler-hours for species "j" divided by the sample total angler-hours for all species in section and month "i".

CPUE was calculated from the sample total number of fish caught divided by the sample total hours fished for each target species within the selected month and section "i". It was assumed that the catch rate was the same for all days of the week. Separate values were calculated for harvested and released fish. Therefore:

$$CPUE_{ij} = SUMFISH_{ij}/SUMHRS_{ij}$$

$CPUE_{ij}$  = catch-per-unit-effort for harvested or released target species.

$SUMFISH_{ij}$  = total observed number of fish harvested or released.

$SUMHRS_{ij}$  = total observed angler-hours expended to catch and release a target species.

Catch is the product of the estimated angler-hours and CPUE for target species, section, and month selected, where:

$$CATCH_{ij} = TOTALAHSP_{ij} * CPUE_{ij}$$

$CATCH_{ij}$  = Estimated catch for a harvested or released target species.

$TOTALAHSP_{ij}$  = estimated angler-hours (subscript i denotes the stratum containing a particular combination of section and month, j denotes target species)

$CPUE_{ij}$  = catch-per-unit-effort for harvested or released target species.

## FINDINGS

Angler surveys began on the Sacramento, Feather, Yuba and American rivers in April, 1998. Surveys began on the San Joaquin and Mokelumne rivers in July and the Stanislaus River in August, 1998.

A total of 38,922 anglers was interviewed, and these data form the basis for the angling effort and harvest estimates.

A total of 3,079,837 angler-hours was spent sport fishing in the Central Valley rivers surveyed. Chinook salmon was the species targeted most. Anglers spent 1,330,017 angler-hours fishing for chinook salmon. Striped bass was the second most targeted species with anglers expending 1,141,327 angler-hours fishing (Table 3).

The most common fish in the creel was chinook salmon followed by striped bass. This survey estimated that anglers harvested 84,181 salmon and 83,503 striped bass. Catfish were also commonly found in anglers' creels with an estimated 66,372 harvested in 1998 (Table 3).
